## Modified Interval Scheduling problem

```
#include <iostream>
```

```
using namespace std;
```

```
struct Job
```

```
{  
    int start, finish; prob  
};
```

```
bool jobComparator(Job s1, Job s2)
```

```
{  
    return (s1.finish < s2.finish);  
}
```

```
int latestNonConflict(Job arr[], int i)
```

```
{  
    for (int j = int count = 0;  
    ret for (j = i-1; j >= 0; j--)  
    { bool x = jobCan  
        if (arr[j].finish <= arr[i-1].start)  
            return j; count++;  
    } printf("Compatible Job Requests = %d", count);  
    return return 0;  
}
```

```
int main()
```

```
{
```

```
    Job arr[]; int i, j, k;
```

```
    printf(for (int i = 0; i < n; i++) "Enter Job Requests. \n");
```

```
    scanf("%d", &j);
```

```
    for (i = 0; i < j; i++) { for printf("Enter intervals. \n")
```

```
        scanf("%d", &n); for (j = 0; j < n; j++) { for (k = 0; k < 2; k++)
```

```
            {  
                scanf("%d", &arr[j][k]); } } }
```

```
    int x = latestNonConflict(arr[], n);
```

```
    printf("%d", x); }
```

start — start time

finish — finish time

Job — structure to contain start and finish time

arr — contains tuples to store struct variables

Triple Nested Loop —  $O(n^3)$  (in main)

Double Nested loop —  $O(n^2)$  in latest Non-conflict
